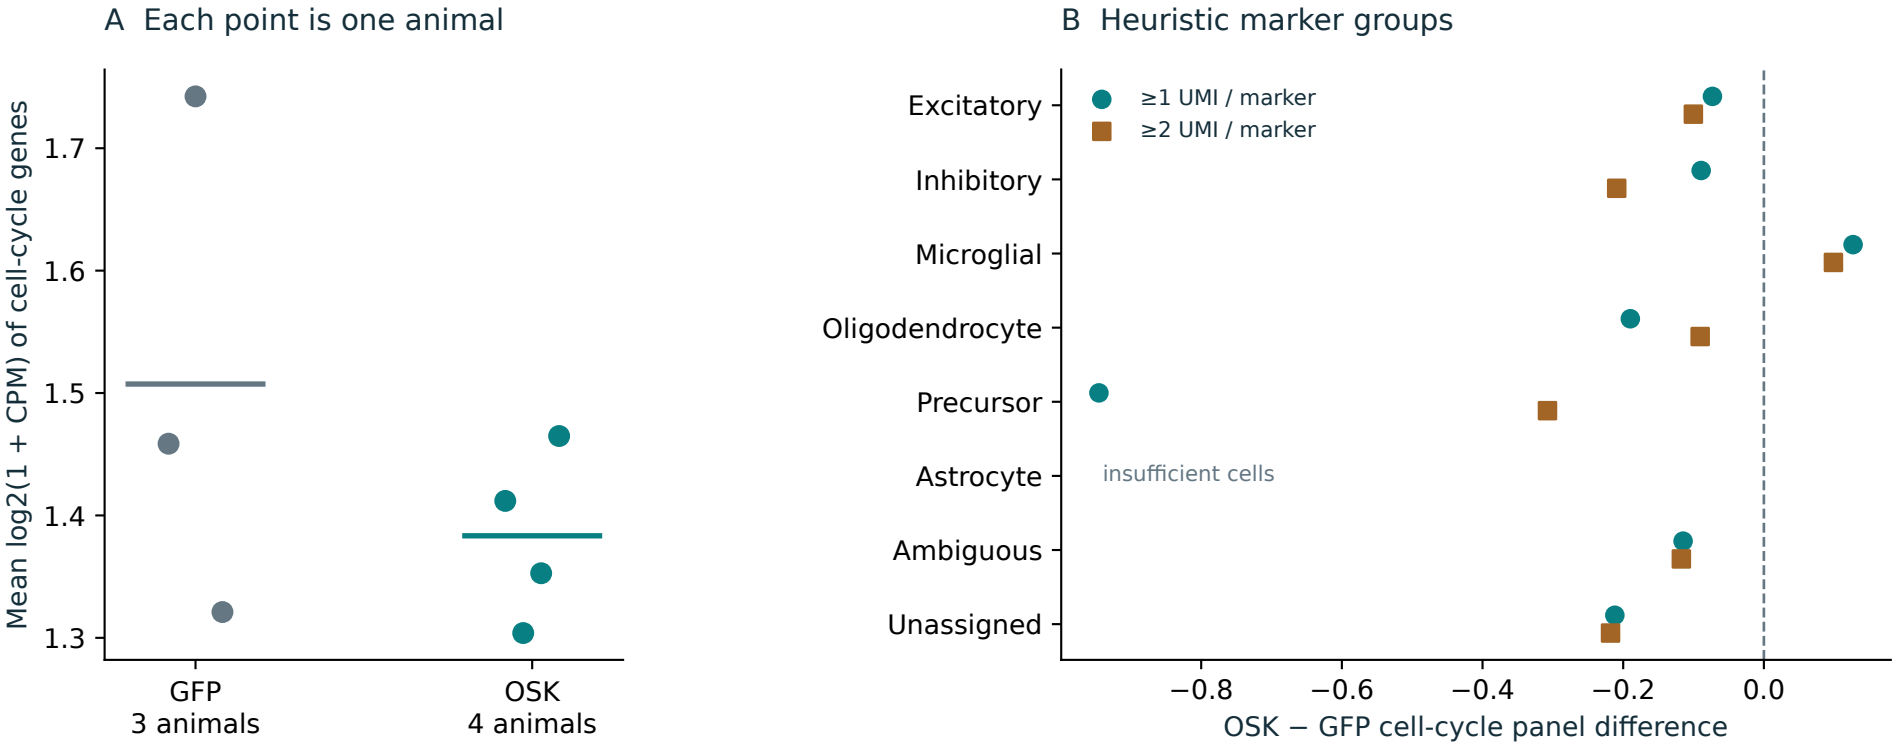
Cell-cycle differences vary across marker groups in an independent mouse study



OSK − GFP = −0.124
Permutation p = 13/35; Holm p = 1.0

GSE276656: seven female APP/PS1 mice in the treatment contrast. Three wild-type animals are context only.
Marker groups require two expressed markers and ≥50 nuclei in every animal; they are not validated cell types.
Points and bars show observed scores/means, not uncertainty intervals. Missing batch labels limit interpretation.
